Runbook and Handover Guide, Version 2.0

Amrit Water WhatsApp AI Sales & Order Agent

Document	Runbook v2.0
Audience	The business owner and whoever maintains the agent
Prepared by	Saloni Sisodiya, AI Solutions Consultant
Date	November 2026
Status	Proof of concept on demo data. Menu names in n8n and Meta can change; use the closest match.

1. What the agent does

The agent replies to customers on WhatsApp, quotes prices from the rate table, takes and confirms orders, records them in a data table, and sends the owner an alert for anything that needs a person: confirmed orders, payment choice, complaints, discount requests, out-of-area delivery and cancellation requests for confirmed orders. It never cancels a confirmed order itself.

2. What the owner receives

Alert	Sent when	What the owner should do
New confirmed order	A customer confirms an order	Check the order, arrange delivery, contact the customer about payment
Payment method	A customer chooses cash or online payment	Share payment details if needed
Complaint	A customer reports a quality or service problem	Contact the customer
Discount or custom rate request	A customer asks for a discount	Decide and reply to the customer
Delivery outside Ratlam	A customer asks for another location	Decide whether to serve it
Cancellation request	A customer asks to cancel a confirmed order	Confirm with the customer, then update the order status by hand

3. Where things live

Item	Location
Workflow	n8n: the AI agent workflow (shows Published when live)
Orders	n8n: Data tables, Amrit_waters_orders
Rates	n8n: Data tables, Amrit_waters_prices
Agent rules	n8n: AI Agent node, System Message (copy kept in prompts/system-prompt.md)
Owner alert number	n8n: notify_owner node, Recipient's Phone Number
WhatsApp credentials	n8n: Credentials; Meta: system user token

Item	Location
Run history	n8n: Executions tab

4. Everyday tasks

Change a rate

1. Open n8n, then Data tables, then Amrit_waters_prices.
2. Edit price_per_carton on the right row, or add a row with min_cartons and the price.
3. The agent reads the table on every price question, so no republish is needed. Send a test price question to confirm.

Change a business rule (delivery charge, delivery area, wording)

1. Open the workflow and double-click the AI Agent node.
2. Edit the rule in the System Message and save the workflow.
3. Click Publish. Changes do not go live until the workflow is published.
4. Run the smoke test in section 6.

Change the owner's number

1. Open the notify_owner node and replace the recipient number (country code, no plus sign).
2. Save and Publish.
3. From the new owner phone, send any message to the business number so WhatsApp's 24-hour window is open.
4. Trigger a test complaint and confirm the alert arrives on the new phone.

Pause the agent

1. Open the workflow and switch it to inactive (unpublish) using the Published control at the top right.
2. Customers who message while it is paused receive no reply. Tell them in advance, or reply by hand.

Resume the agent

1. Open the workflow and click Publish.
2. Run the smoke test in section 6.

Rotate the access token

1. In Meta Business Settings, open Users, then System users, and select the system user.
2. Generate a new token with the whatsapp_business_messaging and whatsapp_business_management permissions. Copy it immediately; it is shown once.
3. In n8n, open Credentials, edit the WhatsApp credential, paste the token and save.
4. Send a test message to confirm replies still work. Note the next rotation date.

Start a clean test conversation

The agent remembers each customer by phone number. To test from a clean state, change the suffix in the Simple Memory node's session key, then save and publish.

5. Pre-release checklist (every change)

1. Edit and save the change in n8n.
2. Click Publish and confirm the workflow shows Published with no unsaved changes.
3. Run the smoke test.
4. Check the Executions tab for red (failed) runs.
5. Export the workflow JSON as a backup (remove phone numbers and tokens before sharing it anywhere).

6. Smoke test (about 5 minutes)

Send this	Expect
hi	A short greeting
What is the price for 20 cartons?	₹102 per carton and ₹2,040 total, free delivery
An order: 5 cartons, a Ratlam address, no customisation	A summary with ₹108 per carton, ₹50 delivery, ₹590 total
yes	Order confirmed, payment question, an owner alert on the owner phone, one confirmed row in the orders table
Water tastes bad	An apology and an owner alert
Where is my order?	The order id and status from the table only

7. Monitoring

- Check the Executions tab daily in the first two weeks, then weekly. Open any red run to see the error.
- Each customer message produces several executions, because Meta also sends delivery and read updates. Watch the plan's execution count.
- Spot-check a few real chats against the orders table each week.
- Review the orders table for old pending_confirmation rows and follow up or clean them up.

8. Troubleshooting

Symptom	Likely cause	What to do
No reply to customers	Workflow not published, or token expired, or the model failed	Check it shows Published; open the latest execution for the error; rotate the token if the WhatsApp node fails
Run shows a rate-limit error	Model usage limit reached	Wait a minute and retry; move to a paid model tier or add a fallback model
Owner does not get alerts	Wrong recipient number, or the owner phone has not messaged the business number in 24 hours	Check the notify_owner recipient; send a message from the owner phone
Alert reaches the customer's chat	Same number used for owner and customer, or old version still live	Use separate numbers; republish
Wrong price quoted	Rate table value wrong or missing	Open Amrit_waters_prices and correct the row

Symptom	Likely cause	What to do
Reply in the wrong language	Earlier chat history influencing the reply	Use a fresh session; report the example so the prompt can be tightened
Odd or internal-looking text in a reply	Model output problem	Check the reply-check step ran; report it; consider a different model
Stray asterisks in a message	Known formatting limitation	Cosmetic; note it in the defect log

9. Data and privacy

- The orders table holds customers' phone numbers and addresses. Limit who can open n8n.
- Delete test orders before real use.
- Never put tokens, phone numbers or credentials in documents, screenshots or public repositories.
- Tell customers they are chatting with an automated assistant and give them a way to reach a person.

10. Backup

- Export the workflow JSON after every change and store it somewhere private.
- Export both data tables as files regularly.
- Keep a copy of the System Message in prompts/system-prompt.md.

11. Known limitations

- Free or trial tiers carry usage limits and, for n8n, a trial end date.
- Memory resets if n8n restarts.
- Owner alerts rely on WhatsApp's 24-hour window; approved templates are needed for production.
- The agent cannot take payments, check stock or schedule delivery.

12. Handover package

Item	Where
Business requirements (v2)	docs/Amrit-water-BRD-v2.pdf
Solution design (v2)	docs/Amrit-water-solution-design-v2.pdf
Test report (v2)	docs/Amrit-water-test-report-v2.pdf
This runbook	docs/Amrit-water-runbook-v2.pdf
Workflow export (sanitized)	workflow/
System prompt	prompts/system-prompt.md
Demo video and screenshots	Project folder and screenshots/
